

## PRESS RELEASE

### Inadequate infrastructure pushes up the risk of disaster

*WorldRiskReport 2016 on the consequences of possible extreme natural events in 171 countries*

Berlin, 25 August 2016 – Inadequate infrastructure and weak logistic chains substantially increase the risk that an extreme natural event will become a disaster. This is a core finding of the WorldRiskReport 2016, which Bündnis Entwicklung Hilft – Gemeinsam für Menschen in Not e.V. and the Institute for Environment and Human Security at the United Nations University in cooperation with the University of Stuttgart presented today in Berlin.

“When it comes to aid measures following extreme natural events, the challenges mostly lie in the ‘last mile’ of the logistics chain: organizing transportation despite destroyed streets or bridges and ensuring fair distribution when there is a shortage of for example water, food and shelter,” explains Peter Mucke, Project Director of the WorldRiskReport and Managing Director of Bündnis Entwicklung Hilft. “Crumbling transport routes, unreliable electricity grids and dilapidated buildings not only hinder humanitarian aid from overseas, but also delay crucial aid for those affected in the event of a disaster.”

“The international community must invest more in the development and maintenance of critical infrastructure even before disasters occur,” says Dr. Matthias Garschagen, Scientific Director for the report and Lead Scientist at the Institute for Environment and Human Security at the United Nations University (UNU-EHS). “Sufficient, high-quality infrastructure, which is well-managed institutionally, can not only prevent the often catastrophic consequences of natural hazards such as flooding or storms, but it can also play a crucial role in the distribution of humanitarian aid supplies in the event of a disaster. Critical infrastructure can thus reduce the risk of natural hazards for populations and it can mitigate economic losses.”

Dr. Iris Menn, Programme Director at Bündnis member Christoffel-Blindenmission (CBM), emphasizes the growing importance of locally organized humanitarian aid: “Actors on site, for instance civil society and church organizations, are often fully familiar with the local, cultural situation and know the people who most urgently require assistance. They are the first ones who can take action in the event of a disaster and they are also there when international aid organizations leave again.”

An important part of the report is the WorldRiskIndex, which was calculated by the Institute of Spatial and Regional Planning at the University of Stuttgart (IREUS). The index assesses the risk of disaster in 171 countries through the combined analysis of natural hazards and societal vulnerabilities. The island state of Vanuatu once again displays the greatest risk in 2016. Germany is ranked number 147. “Societal factors, such as nutrition, medical services and governance, decide to a large extent whether a natural hazard becomes a disaster,” says Dr. Torsten Welle, Senior Scientist at IREUS. “But through targeted interventions the impacts of disasters can be reduced and important lessons can be learned from recognized weaknesses.”

### **Attention journalists:**

- The report can be download at [www.WorldRiskReport.org](http://www.WorldRiskReport.org) from 25.08.2016, 11.00 am CEST onwards.
- You may request additional printable images, infographics and map materials from us.
- We will be glad to send you a printed issue of the WorldRiskReport 2016 and earlier issues. Please send us an e-mail to: [presse@entwicklung-hilft.de](mailto:presse@entwicklung-hilft.de) .
- Our authors are available for telephone or in-person interviews.
